The society of knowledge in which we are inserted has diverse demands in all spheres of human endeavor, and the university professors are not oblivious to this matter. Education, in general, and learning, in particular, is much more than collecting knowledge, or building it, it must be devoted to proposing answers to the problems and the needs we face in the new conditions in which we live.

In this sense, the importance of scientific research for the development of society is more recognized every day. In the same way it is important that people have basic notions of it, even when the scientific view may be disturbing for some.

It is essential to take into account the characteristics of society, if it changes, we have to change as well, in such a way that we move from a society based on control to one based on knowledge, where we have the need to share, interact and disseminate the results of the scientific research.

Research aims to know the different problems that arise in culture, science, psychology, sociology, among others, in which all methods, techniques and procedures that allow the solution of the problem are applied. That is why publishing research results it is important to benefit society, being this one of the challenges for universities in the new context of a globalized world.
